```
CC domain (DED) proteins and nucleic acids encoding them. The invention also CC provides death domain containing protein such as Chlamydia trachomatis CC death domain containing protein such as Chlamydia trachomatis CC death domain containing protein such as Chlamydia trachomatis CC death domain containing protein such as Chlamydia trachomatis CC death for interacting death domain (NIDD) DD and neural growth factor CC identifying a binding agent (e.g. protein or drug) that binds a DD, DED or NB-ARC domain from DAP3, IRAK4, CTDD, DED or NIDD with a candidate CC binding agent and identifying an effective agent (e.g. protein or drug) that modulates the association of a DD, DED or NB-ARC domain with protein or drug) CC that modulates the DP, DED or NB-ARC domain. The invention is also useful for CC infection and B cell immunoglobulin class switching, cell adhesion, CC inflating and/or anti-DD, anti-DED or anti-NB-ARC domain antibodies are CC useful for discovery of drugs that suppress infection, autoimmunity, CC inflammation, allograft rejection, sepsis and other diseases. CDD, DED or NB-ARC domain proteins are used to treat infection, altergy, hyperplasia, keloid, benign prostatic hypertrophy, fibrosis, inflammatory hyperplasia and smooth muscle cell proliferation in arteries CC inflammatory hyperplasia and smooth muscle cell proliferation in arteries CC following balloon angioplasty (restenosis). The invention is also used in the classic interleukin-1 receptor-associated kinase (IRAK)-4 full length gene
         Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                             Claim 18; Page 51-53; 99pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New polypeptide comprising a death domain or death effector domain, useful for discovery of drugs that suppress infection, inflammation, allergy, sepsis, autoimmunity, allograft rejection and other diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention provides novel death Domain (DD) and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Reed JC,

ACC47548
                  The invention relates to a compound of 8-50 nucleobases which is targeted to a nucleic acid encoding interleukin-1 (II-1) receptor-associated kinase-4, specifically hybridising with the nucleic acid and inhibiting the expression of the encoded product. Also disclosed is the compound hybridising with an 8-nucleobase portion of an active site on a nucleic acid molecule encoding II-1 receptor-associated kinase-4. The antisense oligonucleotide is useful for treating an animal having a disease or conditions associated with II-1 receptor-associated kinase-4, e.g. cancer (particularly renal cancer), inflammatory disease or an infection. The antisense compounds are useful for diagnostics, therapeutics, prophylaxis, or as research reagents or kits. The current sequence
                                                                                                                                                                                                                                                                                                                                                                                                          New antisense oligonucleotides for modulating II-1 receptor-associated kinase-4 gene expression, particularly useful for preventing, delaying treating e.g. cancer (e.g. renal cancer), inflammatory disease or an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Cbs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Antisense therapy; cytostatic; antimicrobial; antiinflammatory; interleukin-1 receptor-associated kinase-4; human; cancer; renal cancer; inflammatory disease; infection; diagnostic; therapeutic; prophylaxis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                cc associated kinase (IRAK)-4. IRAK associate with activated II-1, II-18 and conther receptors and act to transduce signals originating from the cother receptors and act to transduce signals originating from the cartivated receptors, ultimately leading to a variety of downstream cffects such as muclear factor (NP)-kappaB activation. The IRAK-4 cc inhibitors are useful for treating inflammatory diseases such as cc pulmonary diseases and diseases of the airway (e.g., adult respiratory disease syndrome (ARDS), chronic obstructive pulmonary disease (opp), cc disease syndrome (ARDS), chronic obstructive pulmonary disease (e.g., cc allergic rhinitis), transplant rejection, autoimmune disease (e.g., cd diabetes), cancer (e.g., solid tumours, skin cancer or lymphoma), cc cardiovascular diseases (e.g., stroke and atherosclerosis), diseases of the central nervous system (e.g., neurodegenerative disease), CD14 cc psoriasis, diseases of the skin (e.g., rash, contact dermatitis, atopic cd ermatitis), inflammatory bowel disease (e.g., Crohn's disease), CD14 cresulting from the activation of an interleukin-1 receptor (IL-IR)/Toll receptor in a cell. They also inhibit the activation of a transduction of combuman transgenic animal which is useful for testing the function of combuman transgenic animal which is useful for testing the function of combuman transgenic animal which is useful for testing the function of combuman transgenic animal which is useful for testing the function of combuman transgenic animal which is useful for testing the function of combuman transgenic animal which is useful for testing the function of combuman transgenic animal which is useful for testing the function of combuman transgenic animal which is useful for testing the function of combuman transgenic animal which is useful for testing the function of combuman testivates of the cell. IRAK-4 is used to create a conditions. IRAK-4 sequences combuman testivates and conditions and conditions and conditions and conditions.

The present sequence is a cDNA encoding mouse interleukin (II)-1 receptor CC associated kinase (IRAK)-4. IRAK associate with activated II-1, II-18 and CC other receptors and act to transduce signals originating from the CC effects such as nuclear factor (NF)-kappaB activation. The IRAK-4 CC inhibitors are useful for treating inflammatory diseases such as cC epidenary diseases and diseases of the airway (e.g., adult respiratory CC disease syndrome (ARDS), chronic obstructive pulmonary disease (OPD), CC pulmonary fibrosis, interstitial lung disease, asthma, chronic cough or CC allergic rhinitis), transplant rejection, autoimmune diseases (e.g., CC inhumatoid arthritis, systemic lupus crythematosus, multiple sclerosis or CC disbetes), cancer (e.g., solid tumours, skin cancer or lymphoma), CC cardiovascular diseases (e.g., stroke and atherosclerosis), diseases of CC cardiovascular diseases (e.g., neurodegenerative disease), CD14 CC mediated sepsis, non-CD14 mediated sepsis, osteoparthritis, atopic CC dermatitis), inflammatory bowel disease (e.g., Crohn's disease and content of the court of the court of the cardiovascular and court of the skin (e.g., rash, contact dermatitis, atopic court of the court of the cardiovascular and court of the cardiovascular of the skin (e.g., rash, contact dermatitis, atopic court of the cardiovascular of the skin (e.g., rash, contact dermatitis, atopic court of the cardiovascular of the cardiovascular and the cardiovascular of the cardiovascular of the cardiovascular of the cardiovascular of the skin (e.g., rash, contact dermatitis, atopic court of the cardiovascular of the 
dermatitis), inflammatory power usesses (v.5), spondylitis, gout, ulcerative colitis), Behcet's syndrome, ankylosing spondylitis, gout, ulcerative colitis, Behcet's syndrome, ankylosing spondylitis, gout, ulcerative colitis, and conditions. The inhibitors of sarcoidosis and ophthalmic diseases and conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                autoimmune disease; rheumatoid arthritis; systemic lupus erythematosus; multiple sclerosis; diabetes; cancer; solid tumour; lymphoma; stroke; cardiovascular disease; atherosclerosis; neurodegenerative disease; sepsis; osteoarthritis; rash; osteoporosis; psoriasis; dermatitis; inflammatory bowel disease; gout; Crohn's disease; ulcerative colitis; Behcet's syndrome; ankylosing spondylitis; II-1 receptor/Toll receptor; sarcoidosis; transgenic animal; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              resulting from the activation of an interleukin-1 receptor (IL-IR)/Toll receptor in a cell. They also inhibit the activation of a transcription factor that activates NFAsppaB in the cell. IRAK-4 is used to create a nonhuman transgenic animal which is useful for testing the function of IRAK-4 in vivo, to generate models for the study of inflammatory diseases and conditions and for the development of potential treatments for IRAK-4-related inflammatory diseases and conditions. IRAK-4 sequences are also used in gene therapy and in antisense therapy
                                                                                                                                                                                                                                                                                                                                          Antisense therapy; cytostatic; antimicrobial; antiinflammatory; interleukin-1 receptor-associated kinase-4; human; cancer; renal cancer; inflammatory disease; infection; diagnostic; therapeutic; prophylaxis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a compound of 8-50 nucleobases which is targeted to a nucleic acid encoding interleukin-1 (IL-1) receptor-associated kinase-4, specifically hybridising with the nucleic acid and inhibiting the expression of the encoded product. Also disclosed is the compound hybridising with an 8-nucleobase portion of an active site on a nucleic acid molecule encoding IL-1 receptor-associated kinase-4. The antisense oligonucleotide is useful for treating an animal having a disease or conditions associated with IL-1 receptor-associated kinase-4, e.g. cancer (particularly renal cancer), inflammatory disease or an infection. The prophylaxis, or as research reagents or kits. The current sequence is utilised in an example from the invention in the design of antisense oligonucleotides, and represents the complement of the human DNA sequence that is given as GenBank accession number ACO16143
                                                                                                                                                                                                                                                                                                                                                                                     (HYSE-)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  문
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CC The invention relates to isolated polynucleotide (I) and polypeptide (II) C sequences. (I) is useful as hybridiation probes, polymerase chain CC reaction (PCR) primers, oligomers, and for chromosome and gene mapping, CC and in recombinant production of (II). The polynucleotides are also used CC in diagnostics as expressed sequence tags for identifying expressed CC genes. (I) is useful in gene therapy techniques to restore normal CC activity of (II) or to treat disease states involving (II). (II) is CC useful for generating antibodies against it, detecting or quantitating a CC polypeptide in tissue, as molecular weight markers and as a food cC supplement. (II) and its binding partners are useful in medical imaging CC situativity of (II). (I) and (II) are useful for treating disorders (IV) in abservant protein expression or biological activity. The CC diagnostice, forensics, gene mapping, identification of mutations CC responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and CC and to produce other types of data and products dependent on DNA and CC and to appear in the printed specification, but was obtained in CC electronic format directly from WIPO at CC ftb. wibo. int/bub/nublished sort segmences

                                                                                                                                                                                                                         ફ
                                                                                                                                                                                                                                                                    밁
                                                                                                                                                                                                                                                                                                            Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to an isolated polypeptide comprising a death CC domain (DD), death effector domain (DED) or NB-ARC domain. The invention CC is useful for identifying a binding agent, preferably a protein or a drug CC that binds a DD, DED or NB-ARC domain, by contacting a DD, DED or NB-ARC CC NIDD (NGPR-interacting Death Domain), with a candidate binding agent and CC detecting the association of the domain and the candidate binding agent, CC by yeast two hybrid assay, immunoprecipitation, SPA, ultraviolet (UV) or CC chemical crosslinking, nuclear magnetic resonance (NMR), mass CC spectroscopy (MS) and FPA. The invention is useful for modulating the CC level of a cell process such as cell proliferation, cell adhesion, cell stress responses, responses to microbial infection and B cell communoglobulin class switching, in particular apoptosis within a cell. CC muridarum, C: pneumoniae, and C. psittaci or a nucleic acid encoding the CC crostion is useful for detecting a Chlamydia infection. The CC complete is useful for detecting a Chlamydia infection. The CC complete is useful for detecting a Chlamydia infection. The CC contribody specifically caused by the oncogenic proteins and for treating bacterial infections by modulating the activity of oncogenic proteins, CC discovery of drugs that suppress infection, inflammation, allergy, sepsis, substance of that suppress infection, inflammation, allergy, allergy, allegate, allergy arthritis, graft versus host diseases such as sepsis, fibrosis, CC arthritis, graft versus host disease. The invention is used in antisense CC therapy and gene therapy. The present sequence is human IRAK4 short gene XX
                                                                                                                                                                                                                                                                                                                                                               Matches 140; Conservative

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             B B

New polypeptide comprising a death domain or death effector domain, useful for discovery of drugs that suppress infection, inflammation, allergy, sepsis, autoimmunity, allograft rejection and other diseases.

Claim 1; Page 174; 209pp; English.

The invention relates to an isolated polypeptide comprising a death domain (DD), death effector domain (DED) or NB-ARC domain. The invention is useful for identifying a binding agent, preferably a protein or a drug that binds a DD, DED or NB-ARC domain, by contacting a DD, DED or NB-ARC domain from DAPS, IRAK4, CTDD (Chlamydia trachomatis DD protein), DED4 or NIDD (NGFR-interacting Death Domain), with a candidate binding agent and detecting the association of the domain and the candidate binding agent,

The present invention provides novel death Domain (DD) and death effector CC domain (DED) proteins and nucleic acids encoding them. The invention also provides death domain containing protein such as Chlamydia trachomatis CC death domain containing protein Such as Chlamydia trachomatis CC death domain containing protein (NIDD) DD. The invention is useful for CC identifying a binding agent (e.g. protein or drug) that binds a DD, DED CC or NB-ARC domain from DAP3, IRAK4, CTDD, DED4 or NIDD with a candidate CC binding agent and identifying an effective agent (e.g. protein or drug) that binds a DD, DED CC or NB-ARC domain with protein CC binding agent and identifying an effective agent (e.g. protein or drug) that binds the DD, DED or NB-ARC domain. The invention is also useful for CC condulating the level of cell process such as apoptosis, cell adhesion, CC cell proliferation, cell stress responses, responses to microbial CC infection and B cell immunoglobulin class switching. DDB, DED8 and NB-ARC domain and both cross are CC consists and/or anti-DD, anti-DED or anti-NB-ARC domain antibodies are CC inflammation, allergy, allograft rejection, sepsis and other diseases. DD, DED or NB-ARC domain proteins are used to treat infection, allergy, hyperplasia, keloid, benign prostatic hypertrophy, fibrosis, cfillammatory hyperplasia and smooth muscle cell proliferation in arteries of inflammatory hyperplasia and smooth muscle cell proliferation in arteries continuity balloon angloplasty (restenosis). The invention is also used in terleukin-1 receptor-associated kinase (IRAK)-4 DD protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New polypeptide comprising a death domain or death effector domain, useful for discovery of drugs that suppress infection, inflammation, allergy, sepsis, autoimmunity, allograft rejection and other diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Claim 1; Page 34; 99pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Reed JC, Godzi

They are cancer associated antigen precursors. These gene products are useful in methods for preventing, diagnosing and/or treating disorders, especially cancer, associated with abnormal expression of human cancer associated antigens. The method comprises contacting a sample from a subject with an agent that specifically binds to the nucleic acid molecule or expression product (of fragment) complexed with a human leukocyte antigen (HLA) molecule and determining the interaction between the agent and the nucleic acid molecule or the expression product as a determination of the disorder
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Preventing, diagnosing and/or treating disorders associated with abnormal expression of human cancer associated antigens.

equences. (I) is useful as hybridisation probes, polymerase chain creaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used conditions are also used conditions are also used conditions. (II) is useful in gene therapy techniques to restore normal contivity of (II) or to treat disease states involving (II). (II) is converted to the say that the detecting or quantitating a converted in tissue, as molecular weight markers and as a food converted in tissue, as molecular weight markers and as a food converted in tissue, as molecular weight markers and as a food converted in tissue, as molecular weight markers and as a food converted in the supplement. (II) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The converted and polynucleotide sequences have applications in convertices, forensics, gene mapping, identification of mutations converted and to produce other types of data and products dependent on DNA and cand sequences of the invention. Note: The sequence data for this content did not appear in the printed specification, but was obtained in celectronic format directly from MIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to isolated polynucleotide sequences. (I) is useful as hybridisation probes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Claim 20; SEQ ID NO 42977; 103pp; English

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to an isolated polypeptide comprising a death CC domain (DD), death effector domain (DED) or NB-ARC domain. The invention CC is useful for identifying a binding agent, preferably a protein or a drug CC that binds a DD, DED or NB-ARC domain, by contacting a DD, DED or NB-ARC (CC NIDD (NGFR-interacting Death Domain), with a candidate binding agent and CC QU detecting the association of the domain and the candidate binding agent, CC CC NIDD (NGFR-interacting Death Domain), with a candidate binding agent, CC QU detecting the association of the domain and the candidate binding agent, CC QU detecting the association of the domain and the candidate binding agent, CC QU detecting the association of the domain and the candidate binding agent, CC QU detecting the association of the domain and the candidate binding agent, CC QU detecting the suseful for medical cresonance (NMR), mass collaborate in the collaborate in particular apoptosis within a cell.

CC CTDD DD protein is useful for detecting a Chlamydia infection. The invention is useful for modulating the activity of concepts to treating bacterial infections by modulating the activity of bacterial proteins and artibody specific for it are useful for suseful for treating immune-based by the oncogenic proteins and for it useful for treating immune-based pathologies, pathologies associated with cell division, inflammatory diseases such as sepsis, fibrosis, therease, the protein collaborate therapy and gene therapy. The present sequence is human IRAK4 protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Matches

The invention relates to an isolated polypeptide comprising a death commain (DD), death effector domain (DED) or NB-ARC domain. The invention comprising a death commander of the comprising a binding agent, preferably a protein or a drug companied binds a DD, DED or NB-ARC domain, by contacting a DD, DED or NB-ARC domain, by contacting a DD, DED or NB-ARC commander of the domain and the candidate binding agent, DED4 or CC NIDD (NGFR-interacting Death Domain), with a candidate binding agent and companied companied commander of the domain and the candidate binding agent and companied companie

CC domain (DED) proteins and nucleic acids encoding them. The invention also CC provides death domain containing protein such as Chlamydia trachomatis CC death domain containing protein (CTDD) DD and neural growth factor CC receptor-interacting death domain (NIDD) DD. The invention is useful for CC or NB-ARC domain from DAP3, IRAK4, (CTDD) DED4 or NIDD with a candidate CC binding agent and identifying an effective agent (e.g. protein or drug) that binds a DD, DED CC or NB-ARC domain from DAP3, IRAK4, (CTDD) DED4 or NIDD with a candidate CC binding agent and identifying an effective agent (e.g. protein or drug) CC that modulates the association of a DD, DED4 or NB-ARC domain with protein CC that binds the DD, DED or NB-ARC domain. The invention is also useful for CC domains the Level of cell process such as apoptosis, cell adhesion, CC cell proliferation, cell stress responses, responses to microbial CC domains and/or anti-DD5 anti-DED or anti-NB-ARC domain antibodies are CC useful for discovery of drugs that suppress infection, autoimmunity, inflammation, allograft rejection, sepsis and other diseases. CD, DED or NB-ARC domain proteins are used to treat infection, allergy, autoimmunity, inflammation, allograft rejection, sepsis, keratinocyte confilammatory hyperplasia, keloid, benign prostatic hypertrophy, fibrosis, inflammatory hyperplasia and smooth muscle cell proliferation in arteries CC inflammatory hyperplasia and smooth muscle cell proliferation in arteries CC converses and smooth muscle cell proliferation in arteries CC interleukin-1 receptor-associated kinase (IRAK)-4 protein

                                                   The present invention provides novel death Domain (DD) and death effector domain (DED) proteins and nucleic acids encoding them. The invention also provides death domain containing protein such as Chlamydia trachomatis death domain containing protein (CTDD) DD and neural growth factor receptor-interacting death domain (NIDD) DD. The invention is useful for identifying a binding agent (e.g. protein or drug) that binds a DD, DED or NB-ARC domain from DAP3, IRAK4, CTDD, DED4 or NIDD with a candidate
                                                                                                                                                                                                                                                                                                        Reed

The invention relates to a compound of 8-50 nucleobases which is targeted to a nucleic acid encoding interleukin-1 (IL-1) receptor-associated kinase-4, specifically hybridising with the nucleic acid and inhibiting the expression of the encoded product. Also disclosed is the compound hybridising with an 8-nucleobase portion of an active site on a nucleic acid molecule encoding IL-1 receptor-associated kinase-4. The antisense oligonucleotide is useful for treating an animal having a disease or
                                                                                                                                                                                                                                                                                                                                                                      kinase-4

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Antisense therapy; cytostatic; antimicrobial; antiinflammatory; interleukin-1 receptor-associated kinase-4; human; cancer; renal cance inflammatory disease; infection; diagnostic; therapeutic; prophylaxis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              cell proliferation, cell stress responses, responses to microbial infection and B cell immunoglobulin class switching. DDs, DEDs and NB-ARC domains and/or anti-DD, anti-DED or anti-NB-ARC domain antibodies are useful for discovery of drugs that suppress infection, autoimmunity, inflammation, allergy, allograft rejection, sepsis and other diseases. DD, DED or NB-ARC domain proteins are used to treat infection, allergy, autoimmunity, inflammation, allograft rejection, sepsis, keratinocyte autoimmunity, inflammation, allograft rejection, sepsis, keratinocyte hyperplasia, heoplasia, keloid, benign prostatic hypertrophy, fibrosis, inflammatory hyperplasia and smooth muscle cell proliferation in arteries following balloon angioplasty (restenosis). The invention is also used in antibody therapy and gene therapy. The present sequence is human interleukin-1 receptor-associated kinase (IRAK)-4 protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           WO2003028636-A2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Homo sapiens
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human IL-1 receptor-associated kinase-4 amino acid sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CC identified: ASK2 protein complex, Pellino-1 protein complex and Pellino-3 CC protein complex. The protein complex are useful for treating diseases and disorders, e.g. stroke, neurodegeneration such as Wallerian degeneration, CC Alzheimer's disease, neurological disorders such as epilepsy, and CC inflammatory conditions such as ulcerative colitis, Crohn's disease or CC atherosclerosis. Proteins identified as being part of the protein CC complexes of the invention are 1D-MYO-inositol triphosphate 3 kinase A, CSK1, ASK2, ASK3, CaMKII beta, CaMKII delta, CaMKII gamma, casein kinase CC II alpha, Cdc37, CHK2, CTCL tumour antigen SE20-4, EF-1 alpha 1, EMAP, CTCL tumour antigen SE20-4, EF-1 alpha 1, EMAP, CTCL tumour antigen SE20-4, EF-1 alpha 1, EMAP, CC proteins of 35.5 Kda and 49.3 Kda, inositol polyphosphate-5-phosphatase, CC inositol-1,4,5-triphosphate 5-phosphatase type 1, IRAK1, IRAK4, KIAA1441, CC MSTP030, Nek9, PAR3, Pellino 1, Pellino 3, podocalyxin-like protein 1
CC precursor, Pushover, a putative S-adenosylhomocysteinase, secretory CC carrier-associated membrane protein 2, surfeit locus protein 2, ubiquitin CC carboxyl terminal hydrolase 11, upstream regulatory element binding caphate caphar cross complementing protein 4 (isoform 1). The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Matches

IRAK associate with activated IL-1, IL-18 and other receptors and act to transduce signals originating from the activated receptors, ultimately leading to a variety of downstream effects such as nuclear factor (NF)-kappaB activation. The IRAK-4 inhibitors are useful for treating inflammatory diseases such as pulmonary diseases and diseases of the airway (e.g., adult respiratory pulmonary diseases and diseases of the airway (e.g., adult respiratory

Novel human interleukin-1 receptor associated kinase polypeptide, for identifying modulators of the polypeptide for treating gout, allergic rhinitis, multiple sclerosis and skin cancer. asthma,

Fig 1; 89pp; English.

CC kinase (IRAK) -4 protection IRAK associate with activated II-1, II-18 and CC other receptors and act to transduce signals originating from the CC activated receptors, ultimately leading to a variety of downstream CC effects such as nuclear factor (NF)-kappas activation. The IRAK-4 CC inhibitors are useful for treating inflammatory diseases such as CC pulmonary diseases and diseases of the airway (e.g., adult respiratory CC disease syndrome (ARDS), chronic obstructive pulmonary diseases (o.g., CC pulmonary fibrosis, interstitial lung disease, asthma, chronic cough or CC allergic rhinitis), transplant rejection, autoimmune diseases (e.g., CC rheumatoid arthritis, systemic lupus erythematosus, multiple sclerosis or CC diabetes), cancer (e.g., solid tumours, skin cancer or lymphoma), CC cardiovascular diseases (e.g., stroke and atherosclerosis), diseases of the central nervous system (e.g., neurodegenerative disease), CD14 cordiated sepsis, onn-CD14 mediated sepsis, osteoarthritis, osteoporosis, CC dermatitis), diseases of the skin (e.g., rash, contact dermatitis, atopic CC dermatitis), Hencet's syndrome, anhylosing spondylitis, gout, CC sarcoidosis and ophthalmic diseases (e.g., crash, contact dermatitis, gout, CC contidosis and ophthalmic diseases (e.g., crash, contact dermatitis, gout, CC contidosis and ophthalmic disease (e.g., crash, contact dermatitis, gout, CC contidosis and ophthalmic disease (e.g., rash, contact dermatitis, gout, CC contidosis and ophthalmic disease (e.g., crash, contact dermatitis, gout, CC contidosis and ophthalmic disease and conditions. The inhibitors of CC contidosis and ophthalmic diseases and conditions of a transcorption of actor that activates on far interleukin-1 receptor (II-IR)/Toll conditions the activates on far activate on of a transcription of actor that activate and of a transcription of conditions and for the develorment of potential treatments of diseases and conditions and for the develorment of potential treatments. disorders and conditions and for the development of potential treatments for IRAK-4-related inflammatory diseases and conditions. IRAK-4 sequences The present sequence is human interleukin (IL)-1 receptor associated K)-4 protein. IRAK associate with activated IL-1, IL-18 as gene therapy and in ö

Wesche H,

WPI; 2001-451860/48.

Novel human interleukin-1 receptor associated kinase polypeptide, for identifying modulators of the polypeptide for treating gout, allergic rhinitis, multiple sclerosis and skin cancer. asthma,

51; Page; 89pp; English.

The patent discloses interleukin (II)-1 receptor associated kinase (IF-4 proteins and their cDNAs. IRAK associate with activated II-1, II-18 and other receptors and act to transduce signals originating from the activated receptors, ultimately leading to a variety of downstream effects such as nuclear factor (NF)-kappaB activation. The IRAK-4 inhibitors are useful for treating inflammatory diseases such as pulmonary diseases and diseases of the airway (e.g., adult respirator) respiratory kinase (IRAK)

The inhibitors of cresulting from the activation are used to inhibit signal transduction cresulting from the activation of an interleukin-l receptor (IL-IR)/Toll receptor in a cell. They also inhibit the activation of a transcription cannon transgenic animal which is useful for testing the function of IRAK-4 in vivo, to generate models for the study of inflammatory diseases and conditions. IRAK-4 sequences contacted inflammatory diseases and conditions. IRAK-4 sequences can consider the study of inflammatory diseases and conditions. IRAK-4 sequences can consider the study of inflammatory diseases and conditions. IRAK-4 sequences can consider the study of inflammatory diseases and conditions. IRAK-4 sequences can consider the study of inflammatory diseases and conditions. IRAK-4 sequences can consider the study of inflammatory diseases and conditions. IRAK-4 sequences can consider the study of inflammatory diseases and conditions.

IRAK-4 sequences are also used in gene therapy and in antisense therapy. The present sequence is a mutant (K213A, K214A) of human IRAK-4 protein. Note: This sequence is not shown in the specification but is derived from human IRAK-4 (SEQ ID NO: 1) shown in figure 1 of the specification (AAE05398)
                                                                                                                                                                                                                                                                                                                                                                                                                          Synthetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Homo sapiens
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    AAE05403 standard; protein; 460 AA

CC activated receptors, ultimately leading to a variety of downstream CC inhibitors are useful for treating inflammatory diseases such as nuclear factor (NF) kappaB activation. The IRAK-4 CC inhibitors are useful for treating inflammatory diseases such as CC pulmonary diseases and diseases of the airway (e.g., adult respiratory CC disease syndrome (ARDS), chronic obstructive pulmonary disease (OPD), CC pulmonary fibrosis, interstitial lung disease, asthma, chronic cough or CC allergic rhinitis), transplant rejection, autoimune diseases (e.g., cradiovascular diseases (e.g., stroke and atherosclerosis), diseases of CC diabetes), cancer (e.g., stroke and atherosclerosis), diseases of the central nervous system (e.g., neurodegenerative disease), CD14 (CC mediated sepsis, non-CD14 mediated sepsis, osteoarthritis, osteoprosis, CC psoriasis, diseases of the skin (e.g., rash, contact dermatitis, atopic CC dermatitis), inflammatory bowel disease (e.g., Crohn's disease and CC ulcerative colitis), Behcet's syndrome, ankylosing spondylitis, gout, CC sardiovascular than activation are used to inhibit signal transduction CC resulting from the activation of an interleukin-1 receptor (IL-IR)/Toll creeptor in a cell. They also inhibit the activation of a transcription CC resulting from the activate models for the study of inflammatory of inflammatory to generate models for the study of inflammatory of conhuman transgenic animal which is useful for testing the function of CC IRAK-4 in vivo, to generate models for the study of inflammatory of sequence is not shown in the specification but is derived from human CC animal transcription of this sequence is not shown in the specification but is derived from human CC TAK-4 (SEQ ID NO: 1) shown in figure 1 of the specification (AAE05398)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The patent discloses interleukin (IL)-1 receptor associated kinase (IRAK) -4 proteins and their cDNAs. IRAK associate with activated IL-1, IL-18 and other receptors and act to transduce signals originating from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel human interleukin-1 receptor associated kinase polypeptide, useful for identifying modulators of the polypeptide for treating gout, asthma, allergic rhinitis, multiple sclerosis and skin cancer.

Novel human interleukin-1 receptor associated kinase polypeptide, useful for identifying modulators of the polypeptide for treating gout, asthma, allergic rhinitis, multiple sclerosis and skin cancer.

Disclosure; Page; 89pp; English.

The patent discloses interleukin (II)-1 receptor associated kinase (IRAK) CC -4 proteins and their cDNAs. IRAK associate with activated II-1, II-18 CC and other receptors and act to transduce signals originating from the CC effects such as nuclear factor (NF) kappaB activation. The IRAK-4 CC inhibitors are useful for treating inflammatory diseases such as nuclear factor (NF) kappaB activation. The IRAK-4 CC inhibitors are useful for treating inflammatory diseases such as cCC disease syndrome (ARDS), chronic obstructive pulmonary disease (OPD), CC disease syndrome (ARDS), chronic obstructive pulmonary disease (OPD), CC quimonary diseases (e.g., solid tumours, skin cancer of the central nervous systemic lupus erythematosus, multiple sclerosis or cardiovascular diseases (e.g., solid tumours, skin cancer or lymphoma), CC disbetes), cancer (e.g., solid tumours, skin cancer or lymphoma), CC disbetes), cancer (e.g., solid tumours, skin cancer or lymphoma), CC disbetes), cancer (e.g., stroke and atherosclerosis), diseases of the central nervous system (e.g., neurodegenerative disease), CD14 psoriasis, diseases of the skin (e.g., rash, contact dermatitis, atopic culcerative colitis), Behcet's syndrome, ankylosing spondylitis, gout, CC dermatitis), inflammatory bowel disease (e.g., Crohn's disease and conditions and ophthalmic diseases and conditions. The inhibitors of conditions are ceptor in a cell. They also inhibit the activation of a transcription factor that activates NFkappaB in the cell. IRAK-4 is used to create a conditions and for the study of inflammatory diseases and conditions. The function of disease is not shown in the specification but is derived from human conditions is applicable variant (G17A) of human IRAK-4 protein. Note: This sequence is not shown in the specification but is derived from human conditions. Is shown in the specification of the specification of the specification (Amproxam) (Amproxam). the specification (AAE05398)
